

# System Analysis and Design for the Small Enterprise, Second Edition

This microcomputer-based systems text emphasizes practical problem-solving tools and strategies, making it relevant to the real world without diluting the basic theoretical content. It combines traditional systems development life cycle (SDLC) techniques with modern fourth-generation language (4GL) and computer-assisted systems engineering (CASE) technology to teach students how to build small-enterprise computer information systems. A sample case study unifies the theoretical concepts and serves as a model for readers to emulate during their own case study.
